HISTOLOGY REPORT

PATH NO:3068/17

LYMPH NODE BIOPSY

CLINICAL

A 33 year old female patient with history of inguinal and cervical lymph node swelling.

GROSS

A nodular mass measuring 2x2x1cm. Section surfaces are firm in consistency white in colour with necrosis. All processed in blocks 1-3.

MICROSCOPY

Sections show a lymph node with effaced architecture. Within it there is an infiltrate which is composed of a proliferation of a mixed population of lymphoid cells. Intersepted in between are multinucleate giant cells and binucleated cells which have prominent macronucleoli. The lymphoid proliferation is demarcated into nodules by fibrous septae.

DIAGNOSIS

Lymph node biopsy; Lymphoproliferative neoplasm.

COMMENTS

Immunohistochemistry is advised for further typing.
